Why is it important to know what hazardous chemicals are in products?

Olga Speranskaya

Co-Director

Health and Environment Justice Support (HEJSupport)

Tomorrow without Toxics International Civil Society Conference on Chemicals 23rd November 2021

Knowing what chemicals are in products leads to:

Cleaner production processes

Safe and more effective circular economy

Better implementation of Agenda 2030

Healthier people and environment

Transparency of information supports Agenda 2030

Access to information throughout the life-cycle

Target 12.4 of SDG 12 By 2020, achieve the environmentally sound management of chemicals and all wastes throughout their life cycle, in accordance with agreed international frameworks, and significantly reduce their release to air, water and soil in order to minimize their adverse impacts on human health and the environment

Target 12.8 of SDG 12

By 2030, ensure that people everywhere have the relevant information and awareness for sustainable development and lifestyles in harmony with nature.

Target 3.9 of SDG 3.

Target 14.1 of SDG 14

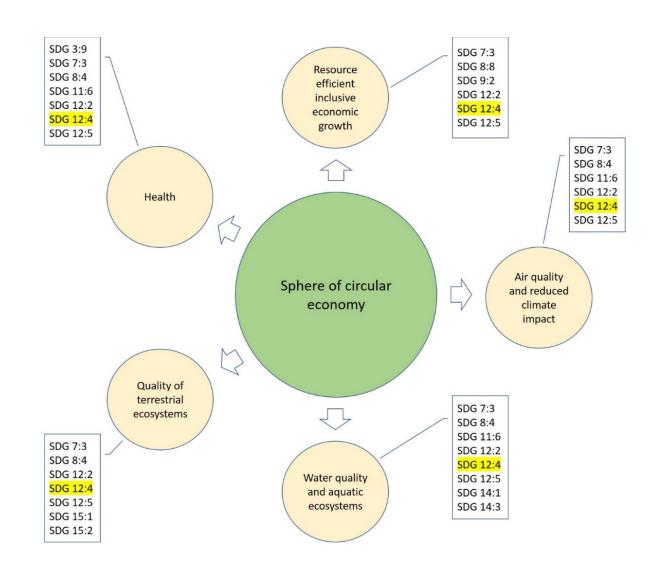

By 2030 substantially reduce the number of deaths and illnesses from hazardous chemicals and air, water, and soil pollution and contamination

By 2025, prevent and significantly reduce marine pollution of all kinds, in particular from land-based activities, including marine debris and nutrient pollution.

14 LIFE BELOW WATER

Information about chemicals in products is key for safe circular economy

Global Chemicals Governance

Chemical

coverage

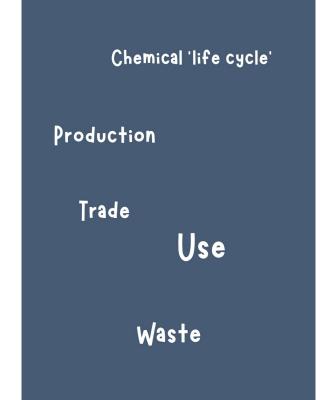

heavy metals

Persistent organic pollutants

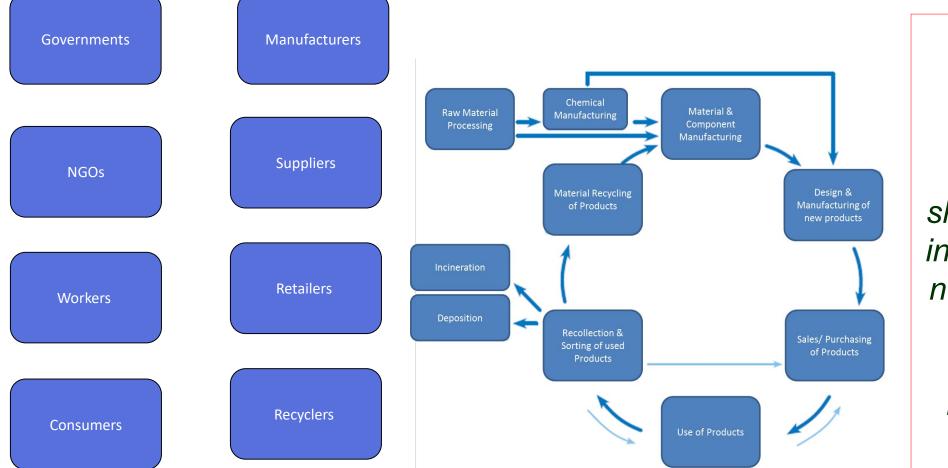

chlorinated and brominated chemicals

Carcinogenic chemicals

Chemicals of other concern, e.g. EDCs, neurotoxicants and immunotoxicants

Who should know about what chemicals are in products?

Stakeholders inside and outside the supply chain should have the information they need to make a sound chemicals management decision

Key requirements for providing information on chemicals in products to consumers

Supplement to the Guidelines for **Providing Product Sustainability** Information focusing on chemicals in products

RELEVANCE Talk about major improvements, in areas that matter Significant aspects ('hotspots') covered Not masking poor product performance, no burden shifting · Genuine benefit which goes beyond legal compliance

TRANSPARENCY

Satisfy the consumer's appetite for information, and do not hide

- Developer of the claim and provider of evidence published
- Traceability and generation of claim (methods, sources, etc.) published
- Confidential information open to competent bodies

"Non-toxic", "Ecologically safe" or "Pollutant free"

CLARITY Make the information useful for the consumer · Exclusive and direct link between claim and product Explicit and easy to understand · Limits of claim clearly stated

RELIABILITY

Build your claims on a reliable basis

Accurate and scientifically true

 Robust and consistent Substantiated data and assumptions

ACCESSIBILITY

Let the information get to the consumer, not the other way around

- · Clearly visible: claim easily found
- Readily accessible: claim close to the product, and at required time and location

Consequences of not knowing what chemicals are in products

- for business
- for environment
- for health

Consequences of not knowing what chemicals are in products: business case

- Sony (2001): high cadmium levels in PlayStation game machine cables, shipment of 1.3 million units
 - Cost: \$150 million in lost sales and product reformulation
- Mattel (2007): <u>lead in paint</u>, more than 9 million toys recalled, including Barbie dolls
 - <u>Costs: \$110 million</u>: in recall costs including communications campaign
 - <u>Stock price down 18%</u>: between August and December 2007
- RC2 Corporation (2007): lead paint on its Thomas & Friends[™] toy trains, 1.5 million units recalled
 - Costs: \$47.6 million: cost of product recall and related to lawsuits
 - <u>Stock price down 50%</u>: From 2007 to 2008 RC2's stock price declined 50%.
- Palm (2006): <u>Treo 650 product fails EU RoHS compliance</u>.
 - <u>Cost</u>: Palm withdraws the product from the European market: stock price down 14% in June 2006
- McDonald's (June 2010): Cadmium in paint on Happy Meal glasses: 13.4 million glasses recalled
 - Costs: exact costs not disclosed, but likely in the US\$ tens of millions

More information in

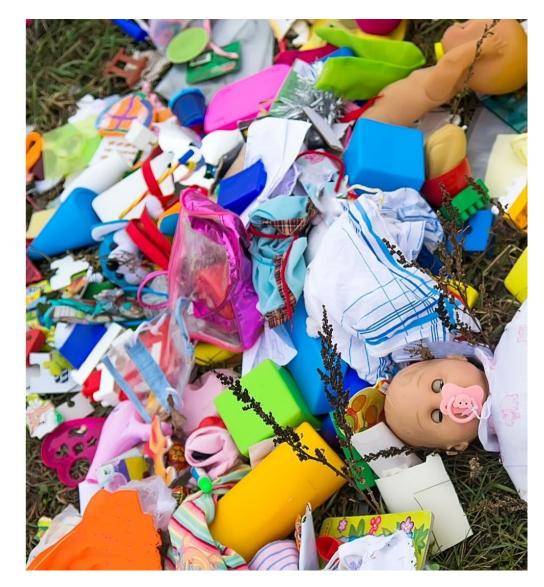

Business Case for CiP information exchange - due diligence and the cost of not knowing https://saicmknowledge.org/sites/default/files/meterial/upload/OEWG/OEWG2/k1403540_-oewg2-_inf12.pdf The Business Case for Knowing Chemicals in Products and Supply Chains

A PUBLICATION IN SUPPORT OF THE **SAICM** EMERGING POLICY ISSUE OF CHEMICALS IN PRODUCTS

Health and environmental consequences of not knowing what chemicals are in products

- Negative environmental effects of products, especially when products are discarded, dumped in landfills, or disposed of by open burning or incineration;
- Toxic chemicals in products can be released into the environment, causing pollution and affecting health;
- Recirculation of toxic chemicals via recycled materials;
- Children across the world play with toys made with toxic plastics, lead and endocrine disrupting chemicals.

Initiatives for providing safer products:

voluntary

- The UNEP Chemicals in Products Programme intergovernmental initiative (https://saicmknowledge.org/sites/default/files/meterial/K1502319%20 SAICM-ICCM4-10-e.pdf
- Design for Environment governmental certification system <u>https://www.epa.gov/saferchoic...</u>
- BASTA industry certification system http://www.bastaonline.se/sear...
- <u>GOTS totally independent</u>

GOTS the leading organic textile standard - GOTS (global-standard.org)

binding

.......

- EU SCIP database for Substances of Very High Concern (SVHC) in products and their constituent components <u>https://echa.europa.eu/sv/scip</u>
- Various national/regional regulations

ECHA database on Substances of Concern in products (SCIP Database)

Companies supplying articles containing substances of very high concern (SVHCs) on the Candidate List (of the European REACH Regulation) in a concentration above 0.1% weight by weight (w/w) on the EU market have to submit information on these articles to ECHA, as from 5 January 2021.

The information in the database is publicly available to waste operators and consumers.

WHAT ARE THE OBLIGATIONS

If the **articles** you **produce**, **assemble**, **import or distribute contain SVHCs** on ECHA's Candidate List in a concentration **above 0.1% weight by weight** you need to **notify** them to the **SCIP database**.

X

National requirements for the same sector and chemicals vary

Restrictions on phthalates in toys in the EU

EU sets restrictions on phthalates in toys that are included in the list of carcinogenic, mutagenic or toxic to reproduction (CMR) substances under the Classification, Labelling and Packaging (CLP) Regulation in <u>a</u> <u>concentration equal to or greater than 0.1 % by weight of the plasticised</u> <u>material in the article</u> (individually or in combination):

- BBP (benzyl butyl phthalate)
- DBP (dibutyl phthalate)
- DEHP (di-(2-ethylhexyl) phthalate)
- DIBP (diisobutyl phthalate)

For toys and childcare products that might be placed in the mouth, REACH also sets a restriction of 0.1% by weight (individually or in combination) for the following phthalates:

DINP (Diisononyl phthalate) DIDP (Diisodecyl phthalate) DNOP (Di-n-octyl phthalate)

Restrictions on phthalates in toys in the EEU (Armenia, Belarus, Russia, Kazakhstan, Kyrgyzstan) provides migratory limits for aquatic media and air:

- DBP (Dibutyl phthalate)
- DMP (Dimethyl phthalate)
- Dioctyl phthalate
- Diethyl phthalate
- Dimethyl terephthalate

Phthalates restrictions under Technical Regulation on Toy Safety in the Eurasian Economic Union

Name	Name	Level of migration	Level of migration
Materials, products	identifiable harmful substance	Aquatic environment (mg/Nm ³), no more than	air (mg/m³), no more than
Polyvinyl chlorides	dibutyl phthalate **	Not allowed	Not allowed
	dimethyl phthalate	0,3	1,007
	dioctyl phthalate	2,0	0,02
	diethyl phthalate	3,0	0,1
Polyethylene terephthalate	dimethyl terephthalate	1,5	0,01
Rubber-latex compositions	dimethyl phthalate	0,3	0,007
	dibutyl phthalate **	Not allowed	Not allowed
	dioctyl phthalate	2,0	0,02
	diethyl phthalate	3,0	0,01

Something went wrong

Information for consumers is often limited to that on product labels which becomes an obstacle to sound decision-making:

Labelling rules and schemes differ from region to region and from country to country

Labels do not contain information about toxic chemicals present in products

Some labels may contain false information

Confidential business information

Non-harmonized rules of information exchange on chemicals in products:

- costly systems for compliance checks at the borders;

- costly control systems imposed on the supply chains in other countries;

- trade between countries is complicated;

-risk for double standards and dumping of products of lesser quality in countries with less ambitious chemicals legislation or means to implement the legislation;

- consumer safety is at risk.

Solution?

GLOBAL MINIMUM TRANSPARENCY STANDARD

EQUAL SAFETY FOR EVERYONE EVERYWHERE

Global Minimum Transparency Standard (GMTS) for hazardous chemicals

Global Chemical Transparency https://www.globalchemicaltransparency.org/

15

Advantages of a globally harmonised standard

- Global information requirements will help countries to request information from suppliers.
- Globally harmonized standards ensure equality before the law and eliminates double standards.
- Globally harmonized standards facilitate safe recycling.
- Globally harmonized standards inspire innovation and safe product design
- Global harmonized standards is a tool for improving access to information.
- Global harmonized standards is a step towards progressive ban of hazardous chemicals in products

Chemicals to be included in information exchange

Disclose	Disclose all intentionally added chemicals in a product (along with impurities that are chemicals of concern) and their hazards;
Disclose	Disclose chemicals based on their potential for significant adverse impacts on human health or the environment based on the Strategic Approach criteria;
Disclose	Disclose chemicals included into the existing or projected regulations in countries where a product is manufactured, sold, used or expected to be disposed of.
Disclose	Disclose chemicals included into the most progressive regulations available in developed countries;
Disclose	Disclose chemicals regulated by the global treaties

17

Development and management

Ideally the global minimum standard should be binding from the beginning

Following a UNEA or UNGA decision, it could be investigated if any of the existing conventions would allow for the inclusion of the standard, e.g. as a protocol. It could be the Basel or Stockholm conventions, or perhaps the Aarhus Convention?

Another option would be to create a global standard like the GHS, which is voluntary, but becomes binding once adopted into national legislation.

Suggested way forward

Continue the work with voluntary disclosure of chemicals in materials and products via the UNEP Chemicals in Products Programme;

Consider two types of increased disclosure obligations for Substances of Global Concern – "soft" and "hard":

- "Soft": Mandatory disclosure of chemical identity and concentration.
- "Hard": Restrictions or bans.

The latter work should be based on a **Globally** Harmonized Minimum Transparency Standard (GMTS).

Read more at: <u>https://www.globalchemicaltransparency.org/</u>

Conclusion

• <u>There are up to 350,000 chemicals on the global</u> <u>market</u>. Most of them have not been tested for their hazardous properties.

• Only limited number of chemicals is regulated in products.

• There are significant differences between the safety requirements for chemical substances in products, including toys between countries and regions.

• Chemical-by-chemical approach is applied in most existing regulations.

• Consumers, retailers, and recyclers are largely unaware about chemical content of products.

• Good initiatives are on the way. However, given the international nature of the product sector, including the supply chain stricter international requirements are needed to ensure that products are equally safe for everyone everywhere

Options for discussion

- Standard based on chemical by chemical approach
- Standard based on chemical family approach
- One standard for all SVHC
- Options for disclosure: Electronic labels;

Physical label

Reported to public database (similar to SCIP database) hosted by IOMC

ESDO & SAICM

- ESDO Successful Intervened in 5th Asia-Pacific regional meeting on the Strategic Approach to International Chemicals Management (SAICM)
- Recently the 5th Asia-Pacific regional meeting on the Strategic Approach to International Chemicals Management (SAICM) is being held in Bangkok, Thailand from 23-25 January, 2018. ESDO took part in the meeting and successfully intervened on ES

Toxic chemicals in cash receipts can make you sick!

Exiting Regulations on chemicals

- Environmental pollutant control ordinance 1997
- Environment Conservation Act, 1995 was enacted for fulfilling three major objectives namely:
 - conservation of environment,
 - improvement of environmental standards
 - the control and mitigation of environmental pollution.
- DOE published the Hazardous Waste (e-waste) Management Rules, 2021 under the Bangladesh Environmental Protection Act, 1995

Environmental Laws: Bangladesh Period

Environmental Laws in Bangladesh mainly focused on the protection of the environment, ecology and ecosystem.

Major Environmental Instruments in Bangladesh:

- ✓ The Wildlife Preservation Order, 1973
- Environment Pollution Control Ordonnance, 1977
- Bangladesh Environment Conservation Act (ECA), 1995 (Amendment Act-2010)
- ✓ Environment Conservation Rules, 1997
- ✓ Bangladesh Environment Court Act, 2000

Environmental laws in Bangladesh are based on the guiding principles stated in the "Bangladesh Environmental Policy 1992"

- ESDO conducted a study on toxic levels in toys During this study, toys were collected from of different stores of Dhaka city markets and sent for analysis to Nepal Bureau of Standard and Metrology (NBSM), Nepal. The selection was based on the country of origin, composition and color.
- Levels of toxic metals in 97% toys tested were significantly above the EU and US recommended ceiling of lead, cadmium, bromine and chromium.
- The plastic toys are the most contaminated as "Toxic Toys" category and the lead is the highest concentrated metal in different category of toy.
- Many international brands like Barbie, and Lego toys also exposed by lead, cadmium and chromium. Local clay and wooden color toys found high concentration of lead and chromium.

Harvesting ideas and securing a better home for a

- The highest level of lead concentration was found as 8305.8 Parts Per Million (ppm) following cadmium 490.5 ppm, chromium 2502.2 ppm and bromine 3923 ppm. All these concentrations are of several times higher than the EU suggested limit.
- 75% of the samples were contaminated with bromine following 62.5% with lead, 27.5% with chromium, 20% with cadmium and 0% with mercury.

- 64% of the parents don't have any idea whether the toys they buy are safe or not
- 88% of parents don't have any knowledge about the toxic metals in toys
- 58% said that their children tend to seek oral motor or sensory input by putting toys in their mouth.
 - Only 20% have noticed health problems of their child due to using or chewing of toys.

Please Keep Their Toys & Paints Safe

Any Amount of Lead is Dangerous To Child Health

 As per the study there is very low level of awareness of and understanding about toxics in toys among businesses and consumers in Bangladesh. Unfortunately, no regulations nor policies on toy safety are currently in place in Bangladesh.

- Another study ESDO conducted with IPEN concluded that lead content in paint is higher than the recommended level and urged for a regulation in restricting lead content in paints
- ESDO committed to continue work for minimizing the toxic chemical use with a view to save the human health and environment.

Manufacturersshould followconsumerprotectionregulations limiting the amountof toxic metals allowed inchildren's toys.Along with,cautionarymessage i.e.labeling should be used on thepacket of toys.Government should formulate a

strict policy to ban on the import, manufacture, sell of toy that contains excess heavy metals. Also governments should force manufacturers to @ siddika Sultana, Provide all hazardous

Recommendation

- **Consumers** should be aware of the toxic metals of toys and should read the labeling of the toys carefully before purchase.
- **Media** should create mass awareness about harmful effects of toxic metals in toys.
- **Third party testing** is required to support a certification of compliance to the rules for children's products that are manufactured after the effective dates listed with each rule.

Lets save Our Future together

Chemicals in products and the right to know

Elise Vitali, Policy Officer on Chemicals

Who are we?

The EEB is **Europe's largest network of environmental citizens' organisations** – and the only one to work on such a broad range of issues.

We have over 40 years of EU environmental policy expertise.

Our 170 members from 35 countries have more than 30 million individual supporters.

Our vision

A better future where people and nature thrive together.

Our mission

We advocate for progressive policies to create a better environment in the European Union and beyond.

The EU policy context

The European Green Deal, Circular Economy Action Plan, Chemicals Strategy for Sustainability, legislations on chemicals and on waste support these objectives:

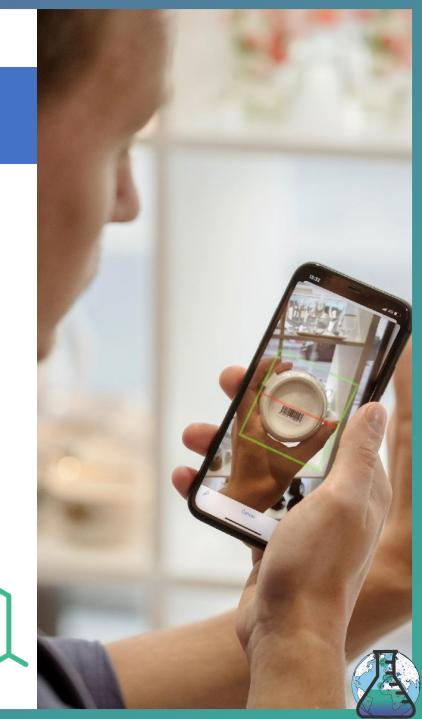

- Transparency: the "Right to know" and access to information about hazardous substances
- The EU's "leadership" for international advocacy
- Reduction of exposure to hazardous chemicals, substitution
- **Resource efficiency**: reduction, reuse, appropriate sorting, recycling

Key developments

- **SCIP database is live** since September 2021
- The Products passport's ambition
- AskREACH project, that aims to make our "right to know" a reality with the Scan4Chem app

Our demands at EU level

A stepwise approach towards traceability

2020 Substances of very high concern2025 Substances of concern2030 Full material declarations

→ a broad definition of "substance of concern"

Additionally:

- traceability and disclosure of information
- enhanced responsibility of producers for the sustainability performance of their products along the lifecycle

How to get there?

- 1. An obligation to communicate information on chemicals in products
- 2. A system to collect and handle information
- 3. **Information available** throughout the life cycle of a product

What we gain from it:

Right to know; better traceability, risk assessment and management; safe and sustainable products

EEB's calls

On decision makers to make transparency is happen, deliver green products and improve safety in the circular economy

On companies to support transparency, and take responsibility for chemicals in their products

For further information:

- globalchemicaltransparency.org
- <u>Briefing</u>: NGOs demand full disclosure of information on chemicals in products, 2017

Multi-lateral Environmental Agreements on Chemicals and Wastes

- Since 1987, a number of multilateral treaties have established rights and obligations as well as goals and targets for different aspects of the sound management of chemicals and wastes.
- They serve to identify and address chemicals and wastes of the highest concern at the global level.
- Legally binding actions to control the use of specific chemicals:
 - the Minamata Convention on Mercury,
 - the Stockholm Convention on Persistent Organic Pollutants
 - the Montreal Protocol on Substances that Deplete the Ozone Layer.
- The Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal aims to protect human health and the environment from the adverse effects of hazardous wastes and other wastes
- The Rotterdam Convention address the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides

Minamata Convention on Mercury

- Long-range transfer, bio-accumulate, bio-magnify
- Adopted by 128 countries in 10 Oct 2013 in Kumamoto
- Entered into force 16 Aug 2017

• As of 30 Oct 2021: ratified by 135 countries

Key elements of the convention

- Reducing the global supply and trade of mercury
- Phasing out mercury added products
- Phasing out mercury from manufacturing processes
- Reducing mercury use in small scale gold mining
- Controlling mercury emissions and releases from industry
- Safely storing mercury
- Managing mercury waste
- Addressing mercury contaminated sites

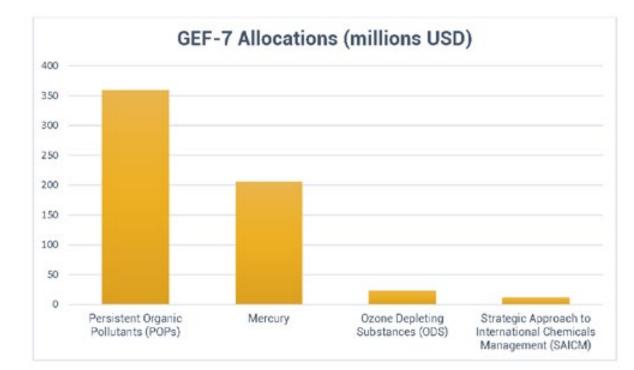

Enabling system: Financial support

Portfolio distribution by resources to GEF-7 focal areas

GEF mercury investment, for 2018-2022, alloted to phase out, reduce and eliminate mercury

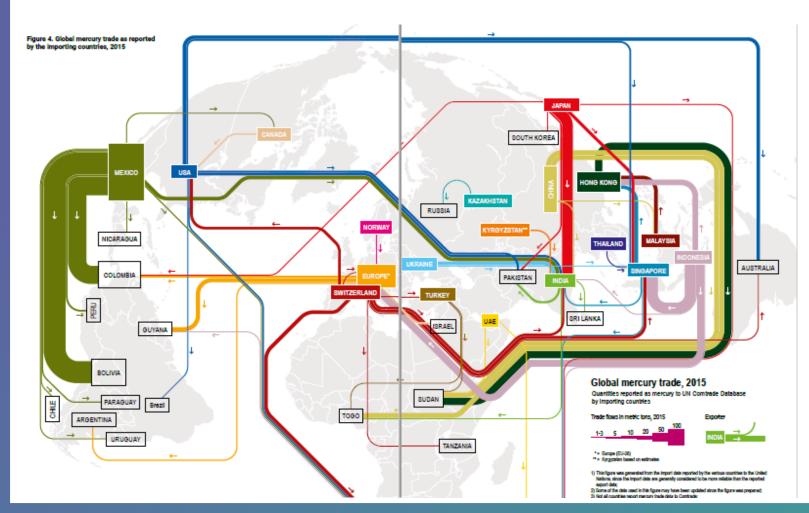

approved by GEF for mercury projects so far

\$5.6 million

million

contributed to the Specific International Programme so far

Article 3 - Mercury supply sources and trade

- Restricts the primary mining of mercury. All primary mining to end after 15 years after entry in force for a party. No new mines.
- Mercury from primary mining only for use in products and processesnot ASGM
- Requires inventory of national stocks
- Chlor-alkali mercury reserves post closure or conversion must be retired.
- Does not require import or export bans.
- Does not prohibit trade in most mercury as a commodity.
- Does not prevent trade in mercury for 'allowable uses'.
- ASGM remains an allowable use.

Article 4 - Mercury added products

- Established phase out date of 2020 for production, export and import of a wide range of mercury added products.
- Limits the mercury content of some products such as CFLs and batteries.
- Lists a 'phase-down' procedure for the use of mercury in dental amalgam. This does not oblige parties to stop using dental amalgam but provides a list of reduction measures and alternative practices.
- Exemptions: for research, cultural use,

Annex A of Hg Convention

Mercury-added products

The following products are excluded from this Annex:

- (a) Products essential for civil protection and military uses;
- (b) Products for research, calibration of instrumentation, for use as reference standard;
- (c) Where no feasible mercury-free alternative for replacement is available, switches and relays, cold cathode fluorescent lamps and external electrode fluorescent lamps (CCFL and EEFL) for electronic displays, and measuring devices;
- (d) Products used in traditional or religious practices; and
- (e) Vaccines containing thiomersal as preservatives.

Loophole: no regulation for mercury use as satellite thrusters

2000 satellites in 2019, 4500 satellites in 2025

Mercury is cheap compare to Xenon and Krypton

\$60/kg vs \$1700/kg vs \$400/kg

Deposited in the north and south within 6-7 years

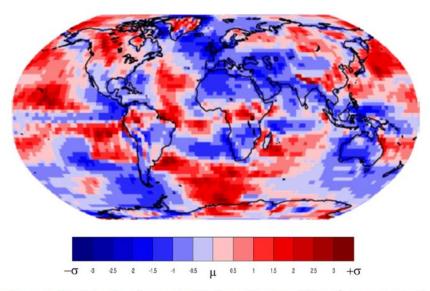

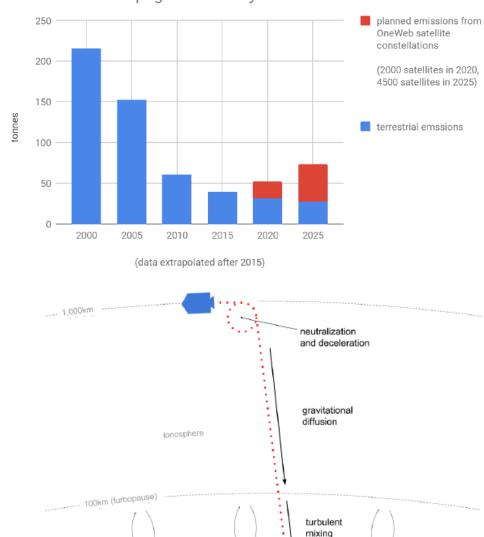

Figure 3. Geographical distribution of annual mercury deposition from satellite emissions (20 Mg yr⁻¹) shown as the probability density function obtained from the ensemble of simulations. Deposition is illustrated in terms of the average ($\mu = 0.03 \,\mu \text{gm}^{-2} \,\text{yr}^{-1}$) and standard deviation ($\sigma = 0.02 \,\mu \text{gm}^{-2} \,\text{yr}^{-1}$) of the ensemble.

Impact of mercury in products

To human health

- Acute vs chronic
- Latency period
- Adverse effects in vulnerable groups: babies, children, indigenous peoples, diffable

To the environment

- Remains in the environment >500 years
- Food chains
- From production process
- From disposal of products with Hg

• IQ lost

Differences of Hg Convention and SAICM approach to CoC in products

Aspects	Minamata Convention	SAICM Beyond 2020
Characteristics of CoCs	Bio-accumulate, bio-magnify, long range transfer	Some of CoCs not bio-accumulate, not bio-magnify, not travel far
Legal status	Legally binding	Non-legally binding
Victims	United, compensations, litigations	United, varied depending on the CoCs and CiPs
Import/export of chemicals	Export ban, precursor (cinnabar) mining prohibited	Double standard, no export ban
Product development	No new products containing Hg	New products with CoCs are raising
National Action Plans	Guidance available, implemented, reported	No National Action Plans
Enabling system	GEF, donor countries	GEF, donor countries
Monitoring parameters	Global standard, fix indicators	Different standards for different CiPs, indicators varies

Similarities of Hg Convention and SAICM approach to CoCs in products

Aspects	Minamata Convention	SAICM Beyond 2020
Characteristics of CoCs	Adverse effects, EDCs	Adverse effects, EDCs
Import/export of chemicals	Regulated	Regulated
Production, use, sale	Sunset date 2020	Sunset date available
Sector/industry	Health, electronics, pesticides	Health, electronics, pesticides
Safer alternatives	Available, enforced	Available
Harmful chemicals known since	1950s	1950s
Monitoring	Environmental matrices, biomarkers	Environmental matrices, biomarkers
National laws/regulations	Available	Available
Enabling system	GEF, donor countries	GEF, donor countries
Interlinkages with other MEAs	Basel Convention, Rotterdam Convention, SDGs	Rotterdam Convention, ICCMs, SDGs

Lessons learned from Minamata

(1) Take actions on symptoms(2) Identify the source of pollution(3) Investigate impact on health

(4) Polluters should be responsible and pay compensation
(5) Raise public awareness
(6) Clean up mercury contaminated sites as soon as possible
(7) Monitor the environment and biomarkers and make it public

Thank you for listening
